where previously there had been vacant space. Then a well-known rectory, fish-ponds, walls, etc., all covered with snow, came into view most vividly and clearly defined. This somehow suggested another view, impressed on his mind in childhood, of a spring morning, brilliant sun, and a bed of red tulips: the tulips gradually vanished except one, which appeared now to be isolated and to stand in the usual point of sight. It was a single tulip, but became double. The petals then fell off rapidly in a continuous series until there was nothing left but the pistil (3), but (as is almost invariably the case with his objects) that part was greatly exaggerated. The stigmata then changed into three branching brown horns (4); then into a knob (5), while the stalk changed into a stick. A slight bend in it seems to have suggested a centre-bit (6); this passed into a sort of pin passing through a metal plate (7), this again into a lock (8), and afterwards into a nondescript shape (9), distantly suggestive of the original cross-bow. Here Mr. Henslow endeavoured to force his will upon the visions, and to reproduce the cross-bow, but the first attempt was an utter failure. The figure changed into a leather strap with loops (10), but while he still endeavoured to change it into a bow the strap broke, the two ends were separated, but it happened that an imaginary string connected them (11). This was the first concession of his automatic chain of thoughts to his will. By a continued effort the bow came (12), and then no difficulty was felt in converting it into the cross-bow, and thus returning to the starting-point.

Fig. 71. Mr. Henslow writes:—

“Though I can usually summon up any object thought of, it not only is somewhat different from the real thing, but it rapidly changes. The changes are in many cases clearly due to a suggestiveness in the article of something else, but not always so, as in some cases hereafter described. It is not at all necessary to think of any particular object at first, as something is sure to come spontaneously within a minute or two. Some object having once appeared, the automatisms of the brain will rapidly induce the series of changes. The images are sometimes very numerous, and very rapid in succession, very frequently of great beauty and highly brilliant. Cut glass (far more elaborate than I am conscious of ever having seen), highly chased gold and silver filigree ornaments; gold and silver flower-stands, etc.; elaborate coloured patterns of carpets in brilliant tints are not uncommon.

“Another peculiarity resides in the extreme restlessness of my visual objects. It is often very difficult to keep them still, as well as from changing in character. They will rapidly oscillate or else rotate to a most perplexing degree, and when the characters change at the same time a critical examination is almost impossible. When the process is in full activity, I feel as if I were a mere spectator at a diorama of a very eccentric kind, and was in no way concerned with the getting up of the performance.

“When a succession of images has been passing, I sometimes determine to introduce an object, say a watch. Very often it is next to impossible to succeed. There is an evident struggle, and it lapes into a warming-pan or other unexpected object.

“This practice has brought to my mind very clearly the distinction between at least one form of automatisms of the brain and volition; but the strength of the former is enormous, for the visual objects, when in full career of the change, are imperative in their refusal to be interfered with.

“I will now describe the cases illustrated. Fig. 71. I thought of a gun. The stock came into view, the metal plate on the end very distinct towards the left (1). The wood was elaborately carved. I cannot recall the pattern. The stock ascended up and down, and crumpled up. The stock broke not unlike a tuning-fork (2). I gave up the stock and expected to find the barrel, but no more of the gun. It turned out to be an old-fashioned flint-lock. It immediately began to nod backwards and forwards in a manner suggestive of the beak of a bird pecking. Consequently it forthwith became converted into the head of a bird with a long curved beak, the knob on the lock (3) of a bird with a long curved beak, the knob on the lock (3) of the beak of a bird, then the head of the bird. I then looked to the right becoming the head of the bird. I then looked to the right becoming the head of the bird. I then looked to the right. The bud appeared unexpectedly a moss rosebud. Its only abnormal appearance was the inordinately elongated sepals (1). I tried to force it to expand. It enlarged but only partially.
